What is GSM?

GSM (Global System for Mobile Communications)

A digital mobile telephone technology that is based on time-division multiple access; it essentially allows you to make a phone call from one mobile to another on the same company account for free, or from a mobile to an office for free as the GSM router also contains a SIM card. It is literally like a mobile to mobile call.

What GSM allows you to do:

- Check your voice mail remotely for free
- Allows you to contact the office without having to worry about mobile bills
- Allows to the office to contact you with important information, without adding to your phone bill
- Cut major costs across company mobiles
- Cut fixed lines costs to company mobiles
- Contact other company mobiles free of charge
- SAVE MONEY
